Clover-Easters 230 kV Electric Transmission Line Rebuild Project

At Dominion Energy, we are committed to providing safe, reliable, and affordable electricity to the communities we serve. You are receiving this postcard because we are planning to rebuild the 230 kilovolt (kV) electric transmission lines between our Clover and Easters substations in Halifax, Charlotte, and Mecklenburg counties, Virginia. The existing structures and related components are at the end of their service life and need to be replaced to meet current electric reliability requirements and safety standards.

Beginning November 2024, we will survey the area and perform soil borings. Our crews will access the right of way on foot or in light duty vehicles to perform this work. The survey crews will flag the right of way boundaries and identify wetlands. The soil boring process involves using equipment to drill holes, sample the soil, and assess its makeup. Soil borings help ensure foundations will provide adequate stability for transmission structures. The holes will be refilled. These activities will take place during firearms deer season and our crews work where hunters may be active. Our crews will be wearing high-visibility work vests to ensure they are easy to see. Please share this information with anyone who hunts on your property to help maintain a safe working environment. Construction activities are expected to occur in mid-2025. Your electric service is not expected to be interrupted because of this project. We will continue to update you as activities progress. Thank you for your patience and understanding as we work to complete this important project.

Protecting the grid against natural and man-made acts is a top priority. You can learn more about our commitment to safety at powerlines101.dominionenergy.com.

Surveying and Soil Boring Work

WHEN
From November to late December 2024

WHERE
Electric Transmission Right of Way
