

- Once again, the Atlantic hurricane season is likely to be more active than normal.

Our customers in South Carolina, North Carolina

and Virginia should be prepared for the potential

for hurricane making landfall

on the most likely months for impact being

August, September, October.

Those months will bring the greatest risk to the east coast,

but it is important to be ready and prepared

from June through November.

Last year, Isaias impacted Virginia

causing catastrophic damage

and spawning over seven tornadoes.

It was one of the 10th worst storms we've seen

in our service territories

in the history of our company.

It affected over 500,000 customers.

Thanks to the hard work of our crews,

we were able to restore power to 80%

of those customers within 48 hours.

It's extremely important to prepare an emergency kit

and a plan before a storm hits.

Throughout the year we're working hard

to make our grid more resilient.

We're also training and preparing

so that our teams are prepared to respond.

If a storm does impact you,

once it is safe and the storm passes,

our crews will be ready to  
quickly repair the damage

and get your lights back on.
