

I love the mountains, and I go up in the mountains, often and look down in the valley, in the wintertime.

In Salt Lake, we have these bad smog and pollution problems, and Hydrogen to me is one way to clean up the air in Salt Lake City and across the globe.

Hydrogen is important to me because I care about the environment and I care about our air quality.

I also care about my kids and their future.

The Therm H2 Pilot Project is a four-phase pilot project we're conducting out here in Utah.

The objective of the project is to prepare our gas infrastructure system to receive 5% hydrogen by 2030.

Working on renewable natural gas projects and hydrogen projects helps Dominion Energy do its part to decarbonize the global economy.

So to me, that's very rewarding.

Hydrogen can change the future of energy because hydrogen can do everything natural gas can do, but with zero carbon emissions.
