

Motus Towers Transcript

It's like a big science group project. We can't be, you know, all along the migratory routes trying to figure out where our birds are going.

The MOTUS towers are a really new way of using old technology to study birds and their movements. We can actually watch in real time the migration of these birds wearing these transmitters, as long as there's a tower in their path.

We want people to understand that places like this need protection. And there are other places like this out there that aren't protected yet and we need them to know that restoring places like this is really important too.

It's really important to have partners like Dominion Energy who can fund our work here in the communities where they also work. We need the funding. We're a nonprofit and to do these extra projects where there is expensive technology involved and wide scoping research, we will be able to do it without funding from partners like that.
