1.0 INTRODUCTION

This *2022 CCR Annual Groundwater Monitoring and Corrective Action Report* (Report) was prepared on behalf of Virginia Electric and Power Company d/b/a Dominion Energy Virginia (Dominion Energy) for the Mt. Storm Power Station (Station) Low Volume Waste Settling Ponds (LVWSP), located in Mt. Storm, West Virginia. The existing LVWSP are subject to the groundwater monitoring requirements in Title 40 Code of Federal Regulations (CFR) Part 257.50 *et seq.* [Disposal of Coal Combustion Residuals (CCR) from Electric Utilities (CCR Rule; Federal Register Vol. 80, No. 74, 21302-21501 on April 17, 2015, as amended)] (EPA, 2015, 2016, 2018, 2020a, 2020b), as well as Title 33 Subsection 33-1B-1 *et seq*. of the West Virginia Legislative Rule Department of Waste Management (WV CCR Rule; effective date of March 1, 2022). Pursuant to the CCR Rule, no later than January 31st annually, the owner or operator of CCR surface impoundments must prepare an annual groundwater monitoring and corrective action report for the CCR surface impoundments documenting the status of groundwater monitoring and corrective action programs for the preceding year.

WSP USA Inc. (WSP) has prepared this Report for the LVWSP on behalf of Dominion Energy in accordance with CCR Rule Part 257.90(e). This Report presents relevant data evaluations from the second semi-annual 2021 event that were completed in 2022, provides the monitoring data and required data evaluations for the first semi-annual 2022 CCR monitoring compliance event performed in April 2022, and provides the monitoring data for the second semi-annual 2022 CCR monitoring compliance event performed in November 2022.

1.1 Site Location

The Station is located at 436 Dominion Boulevard in Mt. Storm, West Virginia approximately 40 miles south-southwest of Cumberland, Maryland. The LVWSP are located directly south of the Station. A Site Location Map is presented as Drawing 1.

1.2 Site History

The Station and adjoining 1,200-acre Mt. Storm Lake were constructed in 1965. Historically, the LVWSP consisted of five low volume waste settling ponds (Pyrite Pond and Ponds A, B, C, and D) which collected wastewater from the Station that included CCR carryover from the fly ash silos and bottom ash hydrobins. The Station has reconfigured the LVWSP by retrofitting the Pyrite Pond, closing the remaining ponds, and reconstructing Ponds A and B in compliance with the CCR Rule. Construction of the new ponds was completed in 2019. Groundwater monitoring at the LVWSP is required under the CCR Rule and was initiated in 2015.

1.4 Monitoring Program Concerns

There were no monitoring program concerns identified during the 2022 AMP compliance events.

2.0 SITE INFORMATION

The Station is a coal-fired power station with a generating capacity of approximately 1,600 megawatts. The first power generation turbine at the Station went online in September 1965 and was followed by the second turbine in June 1966. The third turbine went online December 1973. The LVWSP are located on the Station property directly south of the Station. The LVWSP consist of five low volume waste settling ponds (Pyrite Pond and Ponds A, B, C, and D). The Pyrite Pond is primarily intended to collect materials that cannot be processed by the coal grinding mill and consists of primarily rock but can also be configured to accept receiving water intended for Ponds A or B in an emergency. Under normal conditions, the Pyrite Pond is not considered a CCR surface impoundment per se, but it has the potential to be a CCR surface impoundment based upon LVWSP configuration. As originally designed, Ponds A and B were the primary settling ponds and Ponds C and D were the secondary settling ponds. Discharge from the secondary settling ponds is to Mount Storm Lake pursuant to West Virginia/National Pollutant Discharge Elimination System (WV/NPDES) Permit Number WV0005525. The Station has since reconfigured the LVWSP by retrofitting the Pyrite Pond, closing the remaining ponds, and reconstructing Ponds A and B in compliance with the CCR Rule. Construction of the new ponds was completed in 2019.

As part of the Station operations, Dominion Energy operates the LVWSP for CCR storage. As existing CCR surface impoundments, the LVWSP were subject to the groundwater monitoring provisions of the CCR Rule by October 17, 2017. The DEP incorporated the Federal CCR Rule, by reference, as part of the West Virginia Solid Waste Management Regulations in legislative rule Title 33 Subsection 33-1B-1 *et seq*., effective date of March 1, 2022. As such, the unit is now also subject to the WV CCR Rule.

2.1 Monitoring Well Network

The LVWSP's GMP (TRC, 2017a) details the design of the CCR Rule groundwater monitoring network. As presented in the GMP, the monitoring network is comprised of two (2) upgradient/background wells (OW-7A and OW-8) and five (5) monitoring wells (OW-2A, OW-4A, OW-10, OW-12, and OW-13) located on the natural downgradient boundary of the Unit that are designed to monitor the uppermost aquifer beneath the LVWSP. The groundwater monitoring well locations relative to the LVWSP are shown on Drawing 2.

In addition, the Station maintains fifteen (15) additional observation wells that are presently used for periodic water level monitoring activities.

2.1.1 Monitoring Well Installation and Decommissioning Activities

No groundwater monitoring wells associated with the CCR compliance well network were installed or decommissioned in calendar year 2022.

2.2 Geology and Hydrogeology

A summary of the geology and hydrogeology for the LVWSP is presented in the following sections.

2.2.1 Geology

As presented on the West Virginia geologic map, the Station is located within the high plateau region of the Appalachian High Plateau physiographic province (Cardwell, 1968). The high plateau area is underlain by Paleozoic sedimentary rocks (Ordovician to Mississippian age) and the rocks are folded into a sequence of northeasterly trending parallel anticline and synclines. Locally the area is referred to as the Allegheny Mountains. The Station is located on the eastern limb of the Blackwater Anticline which parallels the Little Blackwater River.

The area is underlain by formations of the Pennsylvanian-age Conemaugh and Allegheny Groups, which include, in descending order:

- Conemaugh Group
  - Buffalo Sandstone
  - Brush Creek shale and sandstone
  - Upper and Lower Mahoning Sandstones
  - Uffington Shale
- Allegheny Group
  - Upper Freeport Coal
  - Bolivar Claystone
  - Upper Freeport Sandstone
  - Lower Freeport Coal

The near surface geology is comprised of unconsolidated colluvium sediments that locally overlie decomposed (saprolitic) sandstone and shale transitioning to fractured competent sandstone and shale interbedded with coal beds. At the Station, the upper Brush Creek and Mahoning coal beds of the Conemaugh Group are absent, while the Upper Freeport and Lower Freeport coal beds of the Allegheny Group are present. The Upper Freeport coal bed is reported to have been mined using a combination of open pit and longwall mining technology, while the Lower Freeport coal bed is reported to be unmined.

2.2.2 Hydrogeology

Two (2) regional aquifers have been identified at the LVWSP; the water table aquifer made up of shale and sandstone units of the Conemaugh Group and a lower leaky confined coal aquifer located within the Upper Freeport Coal of the underlying Allegheny Formation (USGS, 1991). As reported in the Hydrogeological Evaluation Report (TRC, 2016), the Upper Freeport Coal is located immediately below the base of the Conemaugh Group and ranges in thickness from approximately 3.5 to 8 feet. The remainder of the Allegheny Formation and upper portion of the underlying Pottsville Group consists predominately of shale and fire clay with a few relatively thin layers of coal and sandstone. These shale and clay layers effectively impede the vertical migration of groundwater and represent the lower boundary for the uppermost aquifer at the LVWSP. Therefore, the uppermost aquifer underlying the LVWSP consists of the water table aquifer and the underlying leaky confined Upper Freeport Coal. The uppermost aquifer is unconfined and extends vertically into the lowered fractured bedrock formations with the uppermost shale formation acting as an aquitard.

Prior to retrofit of the LVWSPs in 2019, the groundwater flow direction in the uppermost aquifer beneath the LVWSP was towards the south and east. As part of the LVWSP retrofit activities in 2018 and 2019 a dewatering system was installed to maintain a depressed groundwater table beneath the lined LVWSPs. Following installation of the dewatering system the groundwater flow direction in the uppermost aquifer beneath the LVWSP changed from the historical southerly and easterly flow directions to a convergent flow direction that is convergent from all four (4) compass points on the dewatering system installed beneath the LVWSP.

2.2.3 Potentiometric Surface Evaluation

Historical static water level data for the LVWSP are summarized in Table 1. Consistent with the requirements of the CCR Rule, the rate and direction of groundwater flow within the uppermost aquifer beneath the LVWSP was determined after each sampling event. The Potentiometric Surface Map presented as Drawing 2 was prepared using static water level data obtained during the first semi-annual AMP event on April 27, 2022. The Potentiometric Surface Map presented as Drawing 3 was prepared using static water level data obtained during the second semi-annual AMP event on November 9, 2022.

Prior to May 2017 when construction dewatering activities associated with Ponds A, B, and C were initiated, the groundwater gradient and flow direction was generally from the north towards the south and east in the direction of the adjoining Mt. Storm Lake. The monitoring network for the LVWSPs was designed on the basis of this “historical” gradient direction. Beginning around May 2017, construction dewatering activities coupled with the subsequent operation of a permanent dewatering system and the decommissioning of Pond D resulted in an inward gradient developing beneath the LVWSPs, such that the downgradient wells are now upgradient from the LVWSPs and recovered groundwater from the system is managed per Station permits. This condition is expected to continue until such time as the operation of the LVWSPs ceases and the dewatering system operation is terminated.

Dominion Energy continues to evaluate the hydrogeologic conditions for the ponds and will make changes to the monitoring program as appropriate.

Therefore, based on network review and regulatory requirements, WSP believes that the groundwater monitoring wells continue to be operated and maintained so that they perform to the design specifications in the Groundwater Monitoring System Certification for the LVWSPs (TRC, 2017b) consistent with 40CFR Part 257.91(e)(2) of the CCR Rule.

Using the groundwater contours presented as an overlay on Drawings 2 and 3, the average hydraulic gradient for the uppermost aquifer in the study area was calculated for each monitoring event using the following equations.

$$i = {}^{h_L}/_{L}$$

Where: i = hydraulic gradient (unitless)
h_L = head loss (elevation difference in feet)
L = length (horizontal distance in feet)

The groundwater flow rate was calculated using the following formula:

$$V = {}^{ki}/_{\theta}$$

Where: V= Groundwater Velocity (cm/s)
k = hydraulic conductivity (cm/s)
i = hydraulic gradient (unitless)
θ = assumed porosity (unitless)

Using the estimated effective porosity value of 10% for gravelly clay and 20% for weathered rock, the estimated average (geometric) hydraulic conductivity value of 7.06E-04 cm/s calculated from aquifer test data obtained from 15 wells, and the calculated gradients, the average rate of groundwater flow (*Vgw*) for the uppermost aquifer beneath the LVWSP was calculated and is summarized in the following table.

Groundwater Flow	Hydraulic Conductivity (k, cm/s)	Contour lines (feet amsl)	Flow Length (feet)	Average Gradient (i)	Assumed Porosity (Ø)	Estimated Groundwater Velocity	
						(cm/s)	(feet/year)
1st Semi-Annual Assessment Monitoring Program Event (April 2022)							
Vgw	7.06E-04	3252-3242	195	0.043	0.10	3.04E-04	315
		3258-3242	243				
		3244-3242	178		0.20	1.52E-04	157

Groundwater Flow	Hydraulic Conductivity (k, cm/s)	Contour lines (feet amsl)	Flow Length (feet)	Average Gradient (i)	Assumed Porosity (Ø)	Estimated Groundwater Velocity	
						(cm/s)	(feet/year)
2nd Semi-Annual Assessment Monitoring Program Event (November 2022)							
Vgw	7.06E-04	3252-3242	311	0.033	0.10	2.333-04	241
		3256-3242	259				
		3244-3242	164		0.20	1.16E-04	121

As presented, the estimated average groundwater flow rate in the uppermost aquifer north of the LVWSP was variable depending on lithology and ranged from approximately 121 to 315 feet per year. The calculated flow rate for the events conducted in 2022 is generally consistent with previous calculations for the LVWSP.

3.0 FIELD ACTIVITIES

Pursuant to the requirements in 40 CFR 257.95(d)(1) two (2) semi-annual AMP monitoring events and one (1) verification event were completed for the LVWSP in 2022 for the constituents and parameters listed in Appendix III and Appendix IV of the CCR Rule. Summaries of the 2022 AMP sampling events are presented below.

Monitoring Event	Sample Dates	Final Laboratory Package Receipt Date
1st Semi-Annual Assessment Monitoring Program Event	April 28, 2022	June 3, 2022
2nd Semi-Annual Assessment Monitoring Program Event	November 10, 2022	December 13, 2022
2nd Semi-Annual Verification Event	December 21, 2022	January 4, 2023

During each of the AMP sampling events, the compliance monitoring wells were sampled in accordance with the procedures presented in the Station's GMP (TRC, 2017a).

Samples collected during each of the sampling events were shipped via FedEx on ice in secured coolers under chain-of-custody control to Eurofins TestAmerica Laboratories Inc. (TestAmerica) in North Canton, Ohio (#210). Total dissolved solids and radium samples were then shipped to the Pittsburgh, Pennsylvania (#142) and St. Louis, Missouri (#381) locations of TestAmerica for analysis. The three (3) TestAmerica locations are DEP accredited laboratories for CCR Rule Appendix III and IV constituents analyzed.

4.0 LABORATORY ANALYTICAL RESULTS

Laboratory analytical results from the AMP sampling events conducted and/or evaluated 2022 are summarized in the following sections.

4.1 2nd Semi-Annual 2021 Assessment Monitoring Program Event

The groundwater samples collected during the second semi-annual 2021 AMP event were analyzed by TestAmerica for the presence of concentrations of the constituents and parameters listed in Appendix III of the CCR rule and previously detected constituents and parameters of the following Appendix IV of the CCR Rule detects. The laboratory certificates of analysis, chain-of-custody forms, and field logs for the sampling event were previously submitted in the *2021 CCR Annual Groundwater Monitoring and Corrective Action Report*. A summary of the CCR sampling data for the Unit is presented in Table 2.

The laboratory certificates of analysis, chain-of-custody forms, and field logs for the sampling event are presented in Appendix A. A summary of the CCR sampling data for the LVWSP is presented in Table 3.

4.3 2nd Semi-Annual 2022 Assessment Monitoring Program Event

The groundwater samples collected during the second semi-annual 2022 AMP event were analyzed by TestAmerica for the presence of concentrations of the constituents and parameters listed in Appendix III of the CCR rule and previously detected CCR Rule Appendix IV constituents. The current list of Appendix IV detects is as follows:

- Arsenic
- Barium
- Beryllium
- Cadmium
- Chromium

- Lithium
- Molybdenum
- Selenium
- Thallium
- Radium 226 and 228 (combined)

The laboratory certificates of analysis, chain-of-custody forms, and field logs for the sampling event are presented in Appendix B. A summary of the CCR sampling data for the LVWSP is presented in Table 4.

4.3.1 2nd Semi-Annual 2022 Verification Event

The groundwater samples collected during the second semi-annual verification event were analyzed by TestAmerica for the presence of concentrations of cobalt. The laboratory certificates of analysis, chain-of-custody

forms, and field logs for the sampling event are presented in Appendix B.1. A summary of the CCR sampling data for the LVWSP is presented in Table 5.

5.0 DATA QUALITY VALIDATION

The Quality Assurance (QA) and quality control (QC) data provided by the laboratory for the AMP sampling events were reviewed to ensure that the analytical results met the project's data quality objectives as outlined in the Station's GMP (TRC, 2017a). The review process was performed by Environmental Standards, Inc. (ESI) in general accordance with procedures outlined in the National Functional Guidelines for Inorganic Superfund Methods Data Review, January 2017 (EPA, 2017).

5.1 1st Semi-Annual 2022 Compliance Event Findings

The laboratory and field QA/QC data for the first semi-annual compliance monitoring event samples collected April 28, 2022, were reviewed by ESI in accordance with United States Environmental Protection Agency (EPA) Protocol. Field QA/QC samples for this event included a field blank and a duplicate sample that was collected from compliance well OW-10 that were collected at the LVWSP on April 28, 2022. These QA/QC samples were analyzed for the same constituents as the groundwater samples. Based on review of the laboratory-provided QC data and EPA guidance recommendations, the data for this sampling event were determined to meet the data quality objectives for the project with the provided data qualifiers. It is noted that recorded results for calcium were flagged as estimated, biased high, due to matrix spike/matrix spike duplicate (MS/MSD) recoveries outside of acceptable limits. In addition, due to field duplicate imprecision, the recorded radium analysis for OW-10 was flagged as estimated. A copy of the data validation record is presented in Appendix A.

5.2 2nd Semi-Annual 2022 Compliance Event Findings

The laboratory and field QA/QC data for the second semi-annual compliance monitoring event samples collected November 10, 2022, were reviewed by ESI in accordance with EPA Protocol. Field QA/QC samples for this event included a field blank and a duplicate sample that was collected from compliance well OW-2A that were collected at the LVWSP on November 10, 2022. These QA/QC samples were analyzed for the same constituents as the groundwater samples. Based on review of the laboratory-provided QC data and EPA guidance recommendations, the data for this sampling event were determined to meet the data quality objectives for the project with the provided data qualifiers. It is noted that due to laboratory blank contamination, radium results for several samples were flagged as estimated. In addition, the cadmium result recorded for OW-2A was flagged as estimated due to field duplicate imprecision. A copy of the data validation record is presented in Appendix B.

5.3 2nd Semi-Annual 2022 Verification Event Findings

The laboratory and field QA/QC data for the second semi-annual verification event samples collected December 21, 2022, were reviewed by ESI in accordance with EPA Protocol. Field QA/QC samples for this event included a field blank and a duplicate sample that was collected from compliance well OW-2A that were collected

at the LVWSP on December 21, 2022. These QA/QC samples were analyzed for the same constituents as the groundwater samples. Based on review of the laboratory-provided QC data and EPA guidance recommendations, the data for this sampling event were determined to meet the data quality objectives for the project with the provided data qualifiers. A copy of the data validation record is presented in Appendix B.1.

6.0 STATISTICAL EVALUATION OF GROUNDWATER DATA

Per 40 CFR Part 257.94(e)(1), the LVWSP transitioned into the AMP in March 2018. Consistent with the CCR Rule requirements (and as adopted by the WV CCR Rule), the second semi-annual 2021 event data and the 2022 monitoring results were compared to Facility background concentrations and GWPS established on October 17, 2018, as updated.

6.1 2nd Semi-Annual 2021 Assessment Monitoring Data Evaluations

The results from the Unit's monitoring wells were compared to established background concentrations and SSIs were identified over the Unit's background for the second semi-annual 2021 AMP sampling event. Concentrations above background are identified in Table 2.

The following potential GWPS exceedance was identified for the 2nd semi-annual 2021 AMP sampling event based on a value-to-standard evaluation.

Constituent	October 17, 2018 Background Based CCR GWPS (ug/L)	Assessment Monitoring Well	2SA2021 Concentration
Cobalt (µg/L)	34	OW-2A	180
		OW-12	49

Note: ug/L = Microgram per liter

Pursuant to 40 CFR Subpart 257.95(e,f,g), the second semi-annual 2021 results were evaluated against the GWPS. Based on the potential value-to-standard exceedance for cobalt, the cobalt detections at OW-2A and OW-12 were statistically evaluated with a lower confidence limit (LCL) statistical approach. As presented in Appendix C, the LCL calculated for OW-2A was 12.255 ug/L and the LCL calculated for OW-12 was 14.024 ug/L. Both of the LCLs are less than the GWPS and therefore, the potential cobalt GWPS exceedances for cobalt have been refuted.

6.2 1st Semi-Annual 2022 Assessment Monitoring Data Evaluations

Pursuant to 40 CFR Subpart 257.95(e,f,g), the results from the Unit's monitoring wells were compared to updated background concentrations and SSIs were identified over the Unit's background for the first semi-annual AMP sampling event. Concentrations above background are identified in Table 3.

The following potential GWPS exceedance was identified for the 1st semi-annual 2022 AMP sampling event based on a value-to-standard evaluation.

Constituent	October 17, 2018 Background Based CCR GWPS (ug/L)	Assessment Monitoring Well	1SA2022 Concentration
Cobalt (µg/L)	34	OW-2A	36

Note: ug/L = Microgram per liter

Pursuant to 40 CFR Subpart 257.95(e,f,g), the first semi-annual 2022 results were evaluated against the GWPS. Based on the potential value-to-standard exceedance for cobalt, the cobalt detections at OW-2A were statistically evaluated with a lower confidence limit (LCL) statistical approach. As presented in Appendix D, the LCL calculated for OW-2A was 13.1 ug/L, which is lower than the GWPS. Therefore, the potential cobalt GWPS exceedances for cobalt have been refuted.

6.3 2nd Semi-Annual 2022 Assessment Monitoring Data Evaluations

The data for the second semi-annual 2022 AMP sampling event are being evaluated against the GWPS for the LVWSP and the Facility background concentrations in accordance with the CCR Rule timeframes. The results from those evaluations, including the results of the verification sampling, will be presented in the *2023 Annual Groundwater Monitoring and Corrective Action Report*.

The second semi-annual 2022 AMP compliance sampling event was completed on November 10, 2022, with sample analyses complete on December 15, 2022. A verification sampling event was conducted on December 21, 2022, to address suspected exceedances of cobalt at wells OW-2A and OW-12, with sample analysis complete on January 4, 2023. These groundwater sampling and analysis activities were conducted in general accordance with the requirements of the LVWSP's GMP for the CCR network.

Comparisons of the laboratory analytical results from the 2021 second semi-annual and 2022 first semi-annual sampling events to Federal and WV CCR GWPS identified no statistically confirmed GWPS exceedances. Monitoring results from the second semi-annual 2022 AMP event conducted in November 2022 and a verification sampling event conducted in December 2022 are being evaluated against site-specific GWPS in accordance with the applicable CCR Rule timeframe.

7.2 Planned Activities

Based on the results presented herein, Dominion Energy intends to complete the required data evaluations for the second semi-annual 2022 AMP verification sampling event within the CCR Rule prescribed timeframes and continue with semi-annual groundwater monitoring activities in 2023 that are consistent with the provisions in the CCR Rule [Part 257.95 *et. seq*], the WV CCR Rule, and the LVWSP's GMP.

This quality assurance (QA) review is based upon an examination of the data generated from the analyses of the samples collected as part of:

Mt. Storm Power Station Groundwater Sampling
Samples Collected between: 4/26/2022 and 4/29/2022

This review was performed with guidance from the associated US EPA data validation guidelines and in accordance with the Quality Assurance Program Plan. These validation guidance documents specifically address analyses performed in accordance with the Contract Laboratory Program (CLP) analytical methods and are not completely applicable to the type of analyses and analytical protocols performed for the US EPA, SW-846, and Standard Methods utilized by the laboratory for these samples. Environmental Standards, Inc. (Environmental Standards) used professional judgment to determine the usability of the analytical results and compliance relative to the US EPA, SW-846, and Standard Methods utilized by the laboratory. This QA review was performed on the data associated with Job Number:

2401658041

The findings offered in this report are based on a review of holding times and preservation, method blank results, field blank results, filter blank results, equipment blank results, tubing blank results, matrix spike/matrix spike duplicate recoveries and precision, laboratory control sample/laboratory control sample duplicate recoveries and precision, laboratory and field duplicate precision, total and dissolved results comparisons, and/or positive results between the method detection limit and quantitation limit.

The following results were qualified based on the data verification effort:

This quality assurance (QA) review is based upon an examination of the data generated from the analyses of the samples collected as part of:

Mt. Storm Power Station Groundwater Sampling
Samples Collected between: 11/8/2022 and 11/11/2022

This review was performed with guidance from the associated US EPA data validation guidelines and in accordance with the Quality Assurance Program Plan. These validation guidance documents specifically address analyses performed in accordance with the Contract Laboratory Program (CLP) analytical methods and are not completely applicable to the type of analyses and analytical protocols performed for the US EPA, SW-846, and Standard Methods utilized by the laboratory for these samples. Environmental Standards, Inc. (Environmental Standards) used professional judgment to determine the usability of the analytical results and compliance relative to the US EPA, SW-846, and Standard Methods utilized by the laboratory. This QA review was performed on the data associated with Job Number:

2401763791

The findings offered in this report are based on a review of holding times and preservation, method blank results, field blank results, filter blank results, equipment blank results, tubing blank results, matrix spike/matrix spike duplicate recoveries and precision, laboratory control sample/laboratory control sample duplicate recoveries and precision, laboratory and field duplicate precision, total and dissolved results comparisons, and/or positive results between the method detection limit and quantitation limit.

The following results were qualified based on the data verification effort:

This quality assurance (QA) review is based upon an examination of the data generated from the analyses of the samples collected as part of:

Mt. Storm Power Station Groundwater Sampling
Samples Collected: 12/21/2022

This review was performed with guidance from the associated US EPA data validation guidelines and in accordance with the Quality Assurance Program Plan. These validation guidance documents specifically address analyses performed in accordance with the Contract Laboratory Program (CLP) analytical methods and are not completely applicable to the type of analyses and analytical protocols performed for the US EPA, SW-846, and Standard Methods utilized by the laboratory for these samples. Environmental Standards, Inc. (Environmental Standards) used professional judgment to determine the usability of the analytical results and compliance relative to the US EPA, SW-846, and Standard Methods utilized by the laboratory. This QA review was performed on the data associated with Job Number:

2401784961

The findings offered in this report are based on a review of holding times and preservation, method blank results, field blank results, filter blank results, equipment blank results, tubing blank results, matrix spike/matrix spike duplicate recoveries and precision, laboratory control sample/laboratory control sample duplicate recoveries and precision, laboratory and field duplicate precision, total and dissolved results comparisons, and/or positive results between the method detection limit and quantitation limit.

The following results were qualified based on the data verification effort:

Based on QA review, qualification of data was not warranted.
